BRANDING

GLOBAL PAYMENTS MASTER BRAND

All of the sub applications that are created should live under the Global Payments master brand . They should have a resemblance to the master brand while still invoking and over all application branding style.

RECOMMENDATION:

- The Global Payments logo should live in the login screens with in the footer as well as area in applications that make sense (ex: settings), but should not overcome the application's branding style.

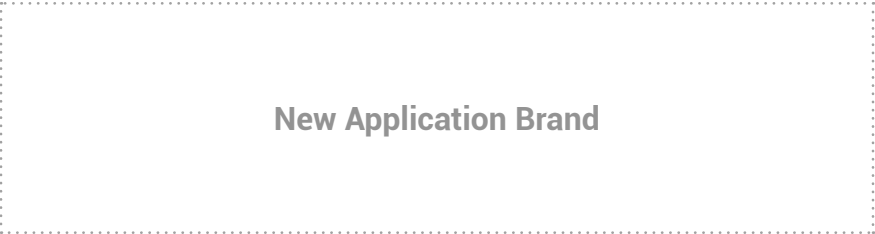

BUSINESSVIEW APPLICATION BRAND

Each application brand should resemble one another for look and feel while still retaining its connection to a cohesive Global Payments application suite.

RECOMMENDATION:

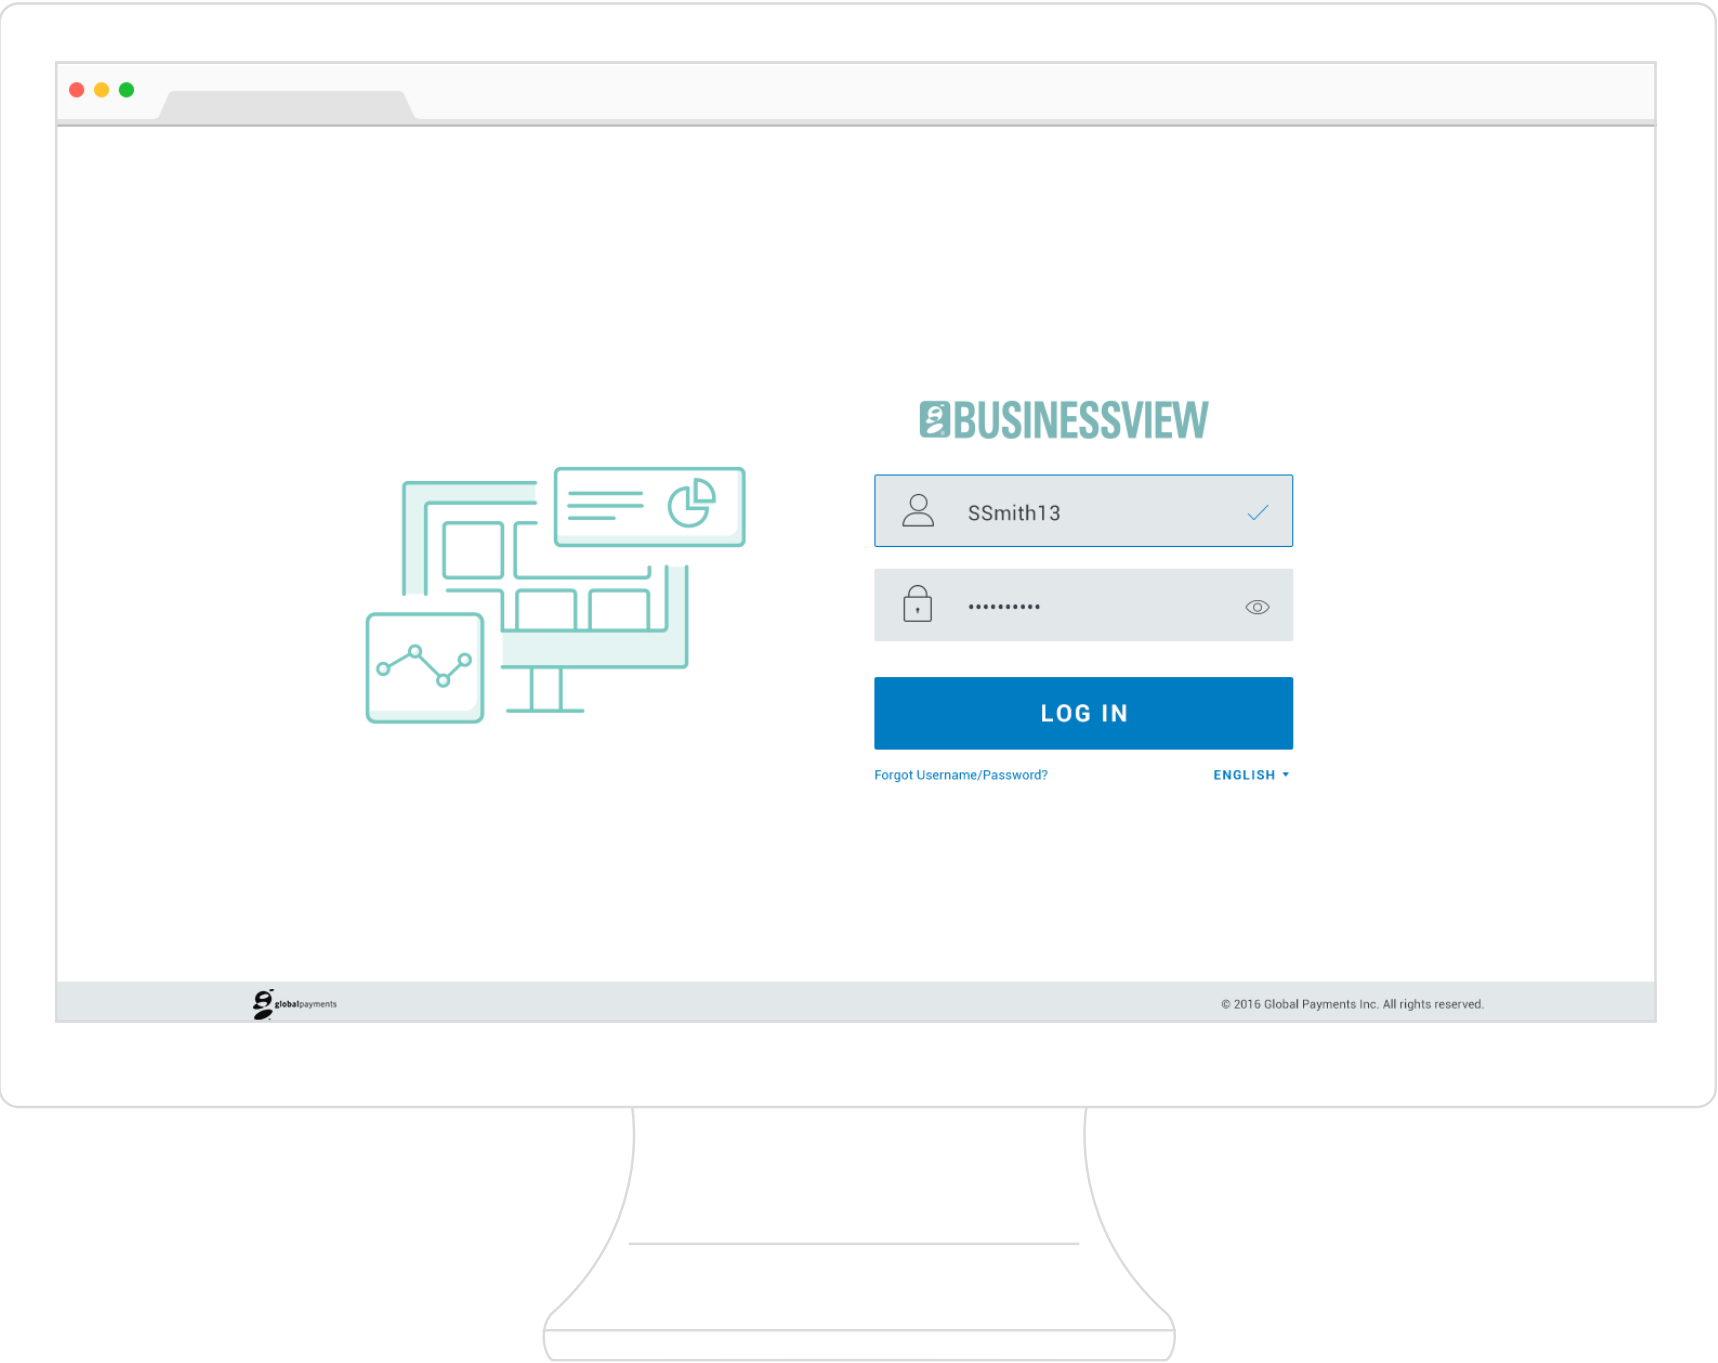

- Identify a distinct logo color for each application.
- Develop and icon system that connects each app's iconography into a suite (for example, the line art style of the navigation icons).
- Display each application's name in a unified typeface to further reinforce their connection to the suite.

BUSINESSVIEW APPLICATION BRAND

New applications should follow the same over arching guidelines/reccomendations as BusinessView to keep consistency across Global Payments application suite.

RECCOMENDATIONS

- The Login screen should keep the applications' branding and style as the prominent look and feel.
- Global Payments branding should always live in consistent places throughout applications.
- Keep consistent positioning for UI and branding elements to connect each login screen across the application suite.

STYLE GUIDE

This Style Guide outlines a general visual style for the BusinessView application UI elements and style as well as visual recommendations for future applications. It is intended as a guide and may not apply in full for every application scenario.

USE OF COLOR

The primary colors should be used as a base for the navigation, typography, and over arching UI elements.

The secondary colors are used for graphical and data visualization elements. Although the red, orange, and green will be used for graph states accounting for negative or positive connotations (ex: sparkline style graph), they will also be used for error, success, and alert states.

TYPOGRAPHY

Header Styles

Aa

Roboto

Thin
Regular
Medium
Bold
Bold Condensed

USE OF TYPOGRAPHY

- The Roboto font family is used throughout the designs for titles, headlines, subtitles, and any concise blurb of information.
- In order to increase legibility, Oxygen Regular is used for body copy in rich content areas.

Body Copy

Oxygen Regular

Lorem ipsum dolor sit amet, quis ut lorem lorem risus fringilla, netus risus wisi at et, est gravida lorem vestibulum. Vestibulum nonummy fermentum, nibh accumsan mauris justo, maecenas mi ac id vestibulum, sollicitudin congue vivamus augue amet est.

USE OF TITLES AND HEADLINES

- Title and headline styles should be used consistently throughout the application design.
- Examples shown are some of the most commonly used.
- Examples of titles and headlines are pulled from:
 - Dashboard
 - Dashboard
 - Dashboard
 - Help Center Detail

Article Titles & Headlines ●

Vestibulum ante ipsum primis in faucibus orci luctus et ultrices posuere cubilia Curae; Pellentesque ut blandit ex, id convallis quam

ICONOGRAPHY

Basic Icons

Illustrative Icons

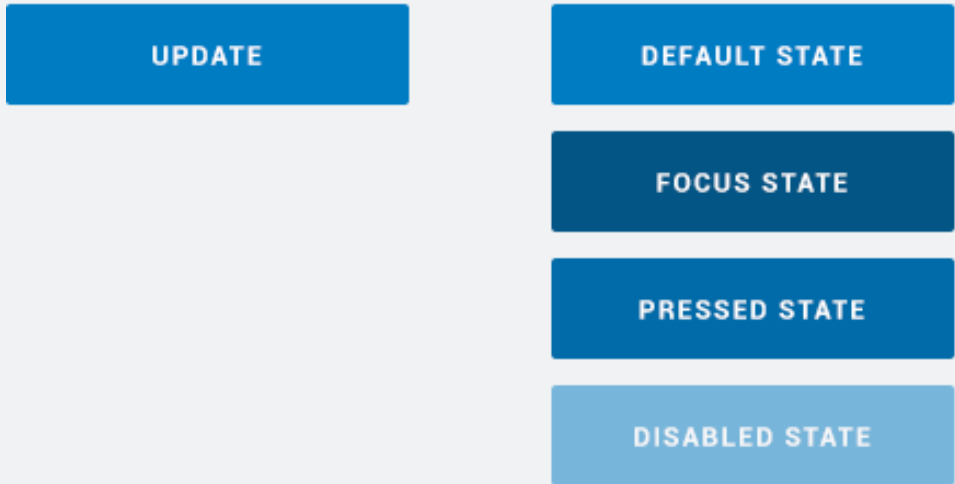

USE OF ICONOGRAPHY

- Basic icons are used for navigation, and represent various other capabilities throughout the application. The style of these icons should be kept simplistic and understandable.
- Active and hover states for these icons vary depending upon their usage within the designs. These states are provided within the UI Kit.
- Illustrative icons are used to add more visual emphasis and branded experience. They are recommended to be used within log in, notifications, and the Help Center. Overall, these type of icons should be used sparingly.

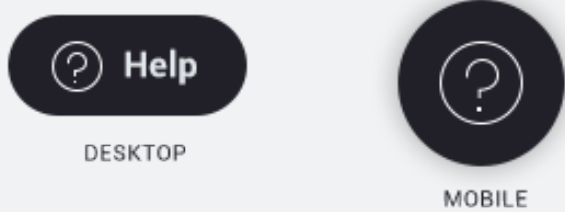

BUTTON STYLES

Primary Button

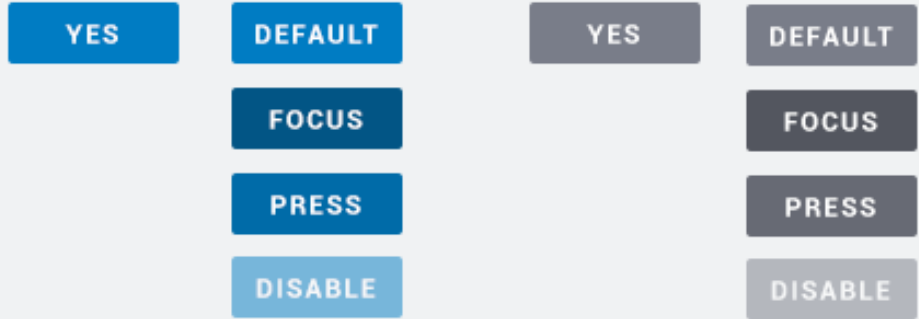

Floating Action Button

USE OF BUTTONS

- The primary button style will be used in most instances.
- The secondary button style is used in areas where a larger quantity of buttons are presented, such as on the Reports List, or when the buttons require less visual prominence, such as on Help Detail. The secondary button can be used in either blue or grey.
- The floating action button is used exclusively for the Help modal, and will be persistent on every screen.
- The buttons have clear differences for each state.

Username does not exist

Parameter forms

MERCHANT ID

02841977080127XXX ▼

CARD NUMBER

USE OF FORMS

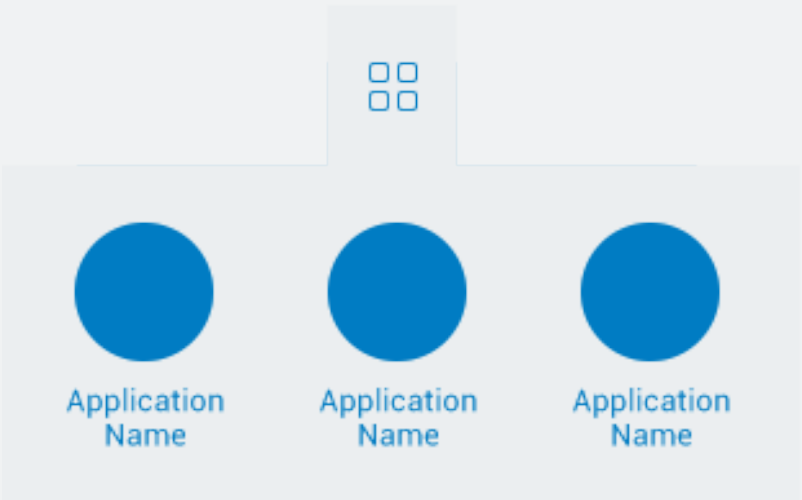

- The Sign In forms are significantly larger than forms used throughout the rest of the application.
- Distinctive form states are used to aid the user through the process of signing in. The default state will show muted text to indicate that no data has been typed in. Once the user fills in the information, the text will change to a dark grey. Verified and error states will help the user log in effectively.
- All other forms are presented at a smaller scale and will either be standard forms, or drop down forms.

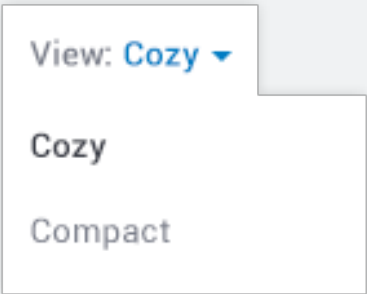

DROP DOWNS

DROP DOWNS

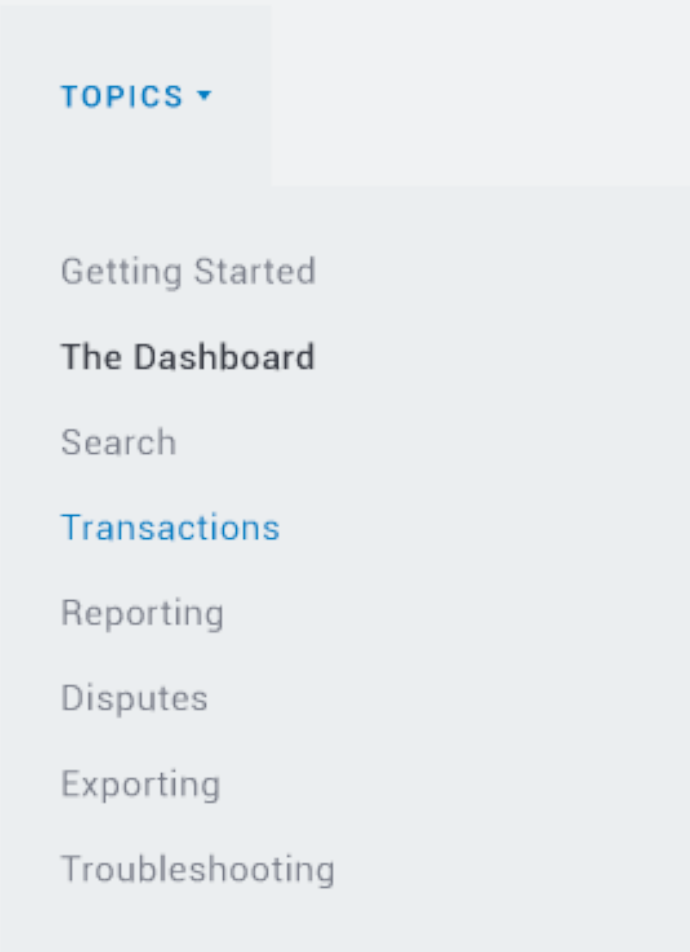

Icon Dropdown ●

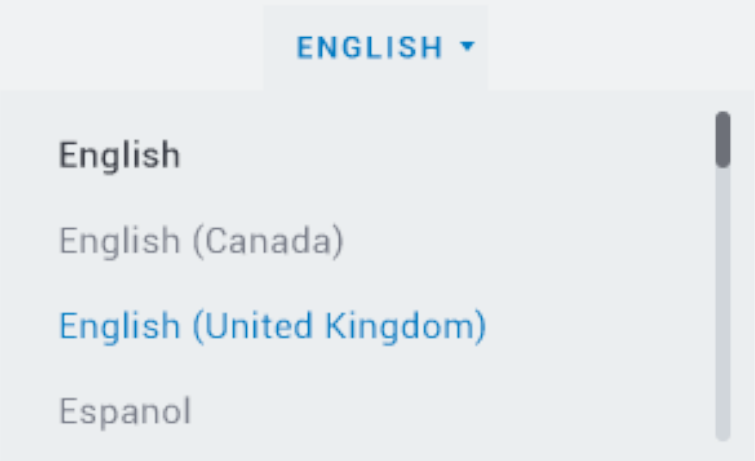

Toggle Dropdown ●

Navigation Dropdown ●

Scrollable Dropdown ●

USE OF DROP DOWNS

- All drop downs will have a consistent background color of light grey, unless they appear within or on top of other content, such as the toggle dropdown.
- Active elements within the dropdown will be dark grey, and the hover state will be blue.
- Examples of dropdowns are pulled from:
 - **Dashboard**
 - **Help Center**
 - **Sign In**
 - **Transaction List**

SELECTION CONTROLS

Radio Buttons

- ☐ Lorem ipsum dolor sit amet
- ☒ Consectetur adipiscing elit
- ☒ Donec laoreet interdum justo non vulputate
- ☐ Duis aliquet urna ipsum, id fringilla turpis
- ☐ Gravida in. Proin mollis consectetur pulvinar

Switches

USE OF SELECTION CONTROLS

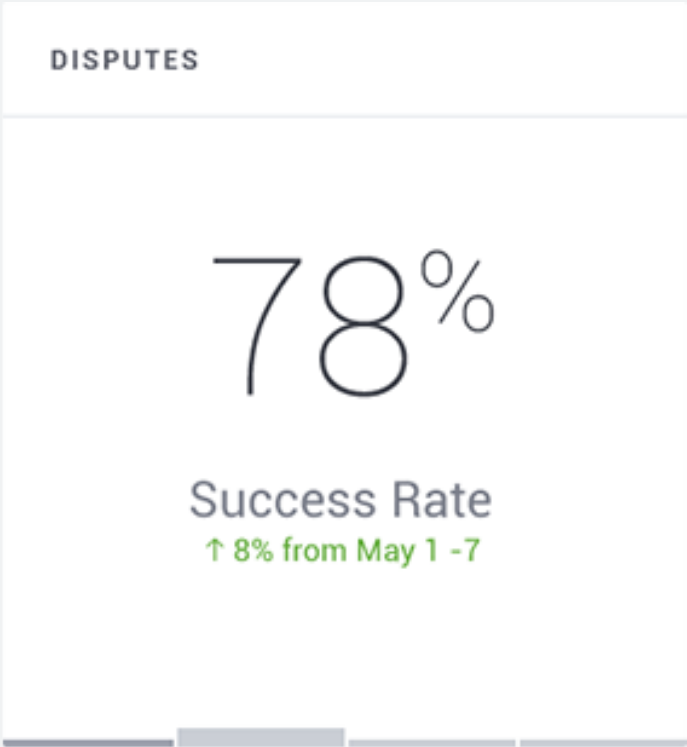

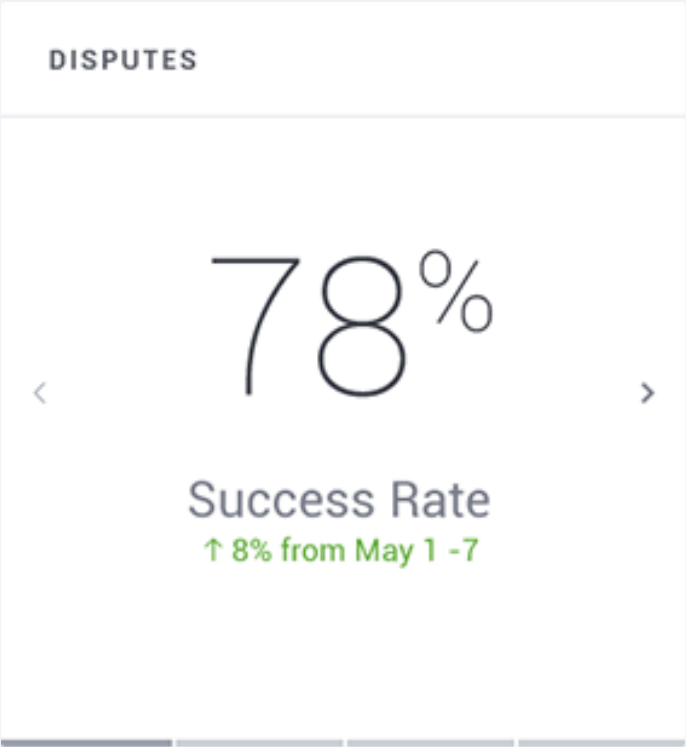

- Radio buttons allow the user to select one option from a set. Use radio buttons for exclusive selection if the user needs to see all available options side-by-side.
- Check boxes allow the user to select multiple options from a set. If only one option is present, refrain from using check boxes, and use a switch instead.
- On and off switches are used to toggle the state of a single settings option. If more than one option is present, use check boxes.

Check Boxes

- ☒ Lorem ipsum dolor sit amet
- ☒ Consectetur adipiscing elit
- ☐ Donec laoreet interdum justo non vulputate
- ☐ Duis aliquet urna ipsum, id fringilla turpis

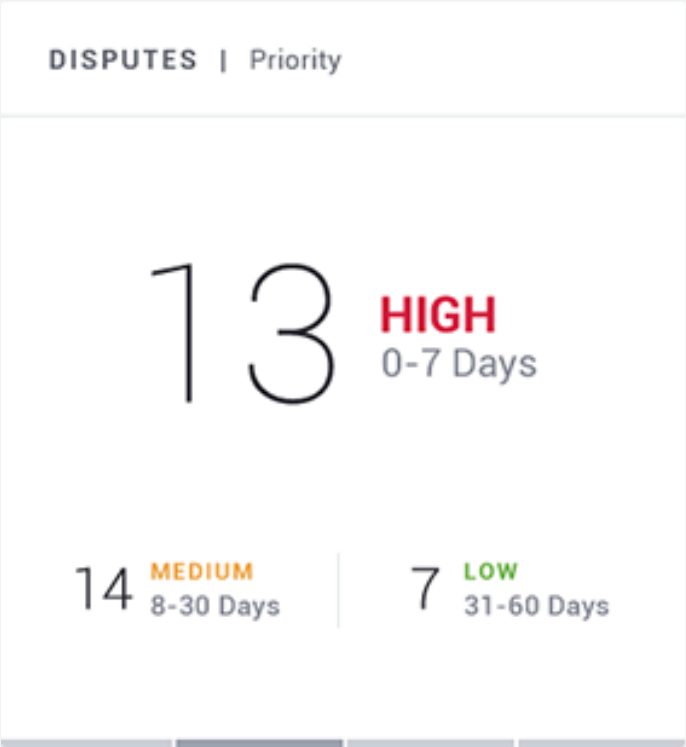

WIDGET BEHAVIOR

USE OF WIDGET PAGINATION

- Widget pagination can be achieved in two different ways. By hovering on the widget, pagination arrows will appear on the left and right edges of the widget.
- Pagination bars are consistently present along the bottom of widgets. Shown is the active state, with the darker grey bar, and the hover state, with the thickened grey bar.

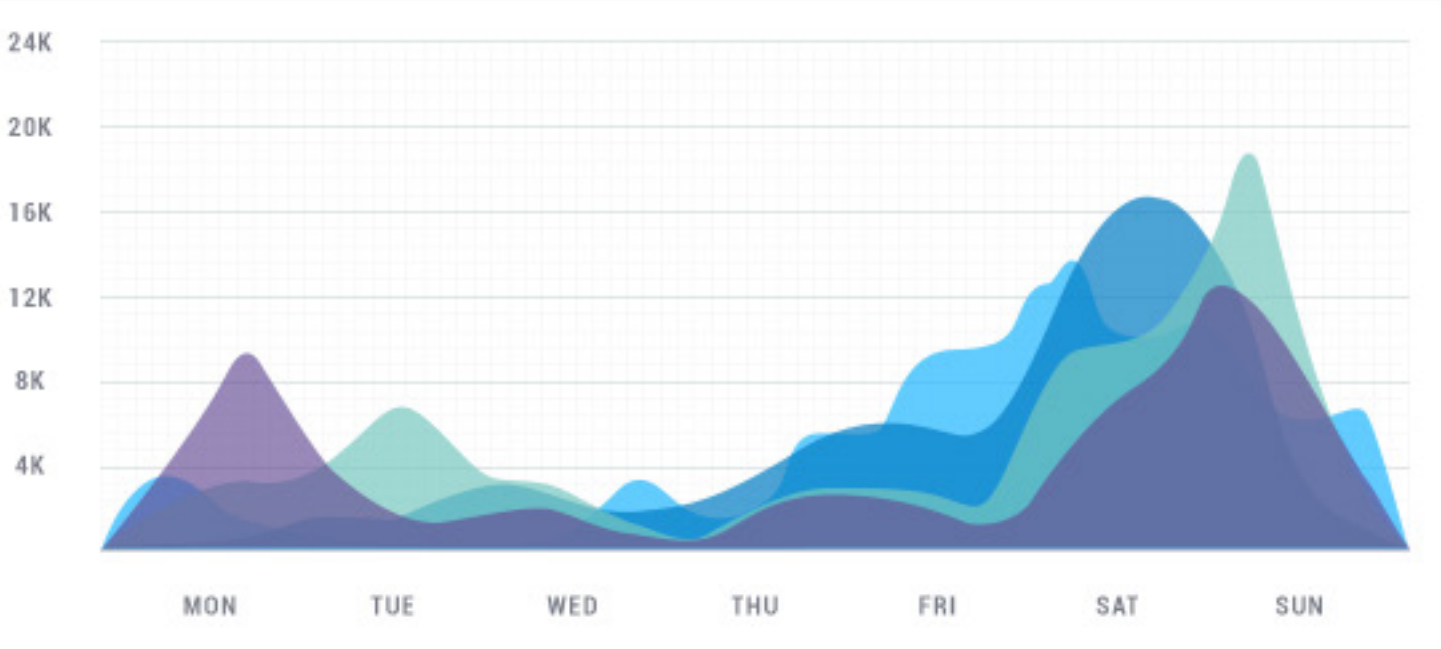

GRAPHS & CHARTS

Each graph and chart within BusinessView is used with purpose for the optimal visualization for the specific data. Data visualization is used to assist the user with their goal when using the product. Always remain cognicent of the user when generating new funtionality for BusinessView.

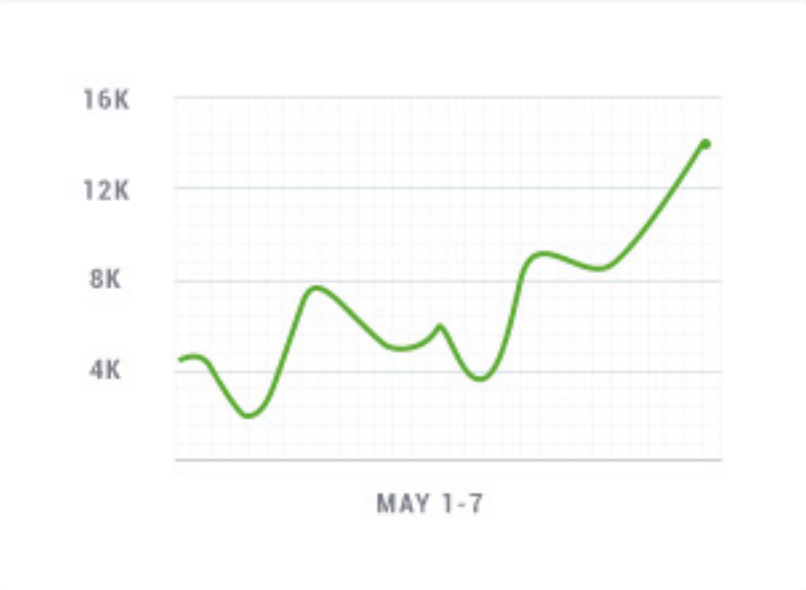

Area Graph

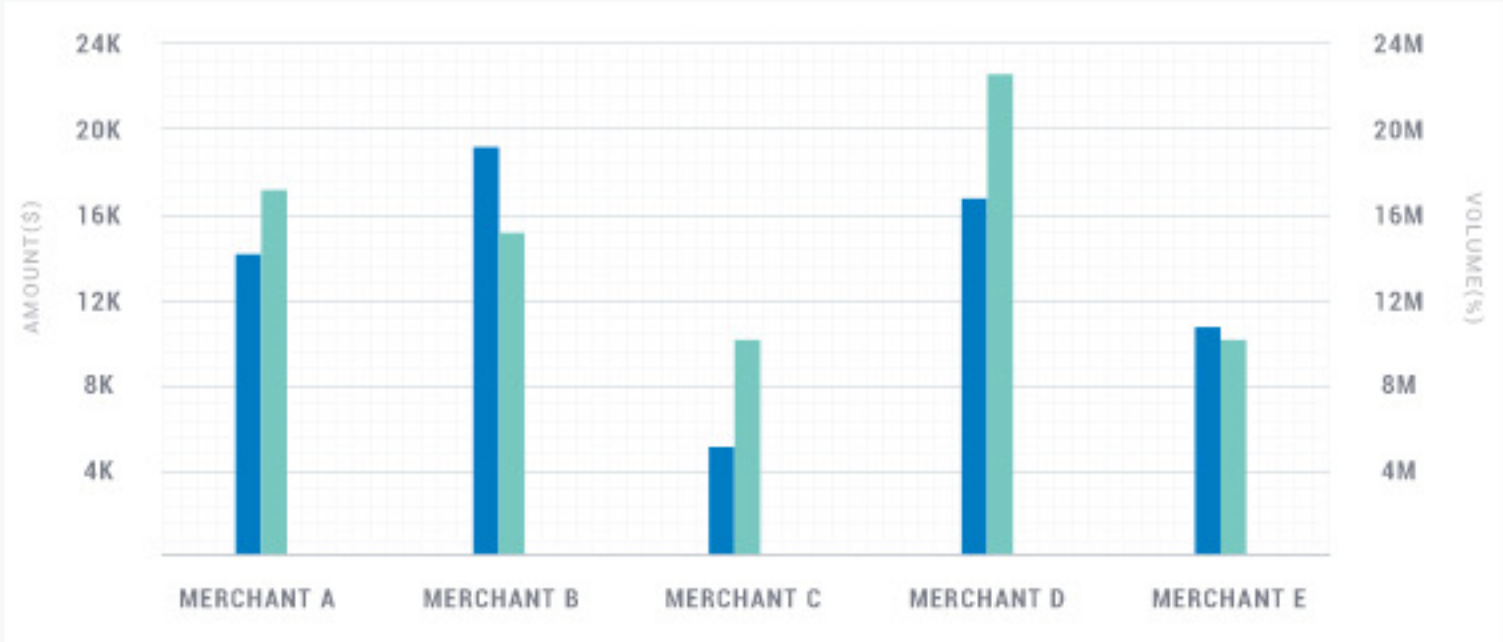

Donut Chart

Sparkline

Bar Graph

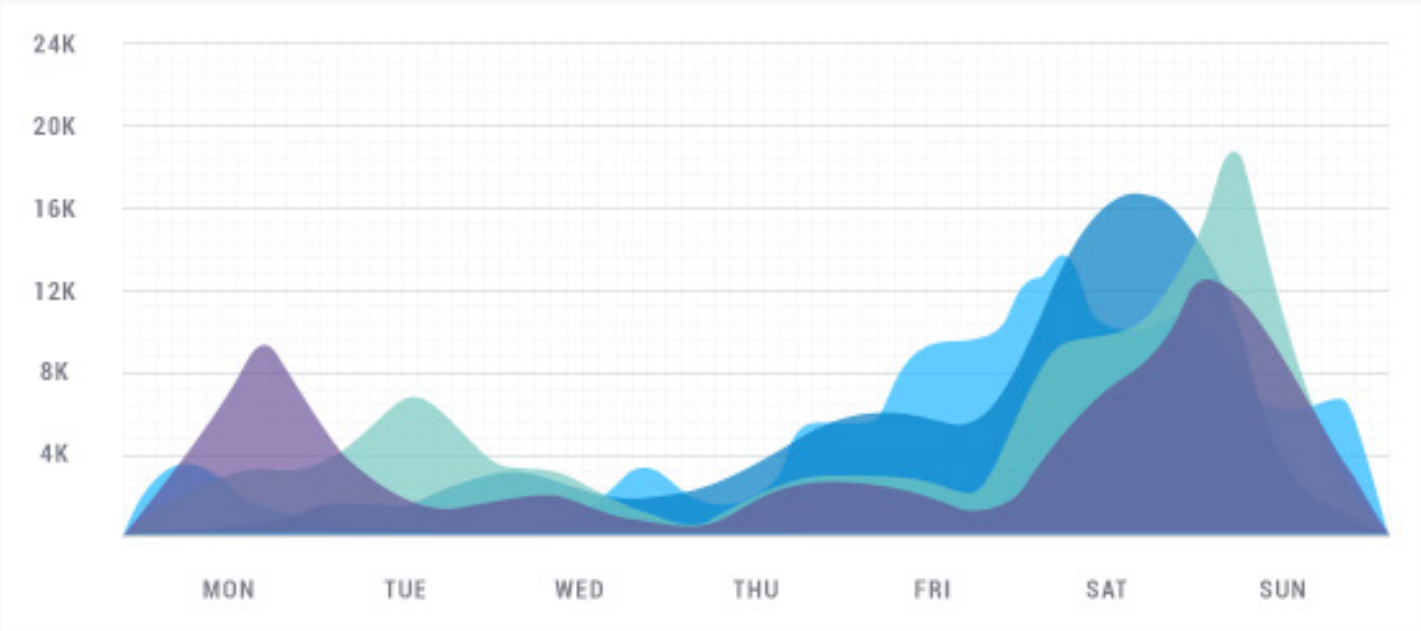

USE OF GRAPHS AND CHARTS

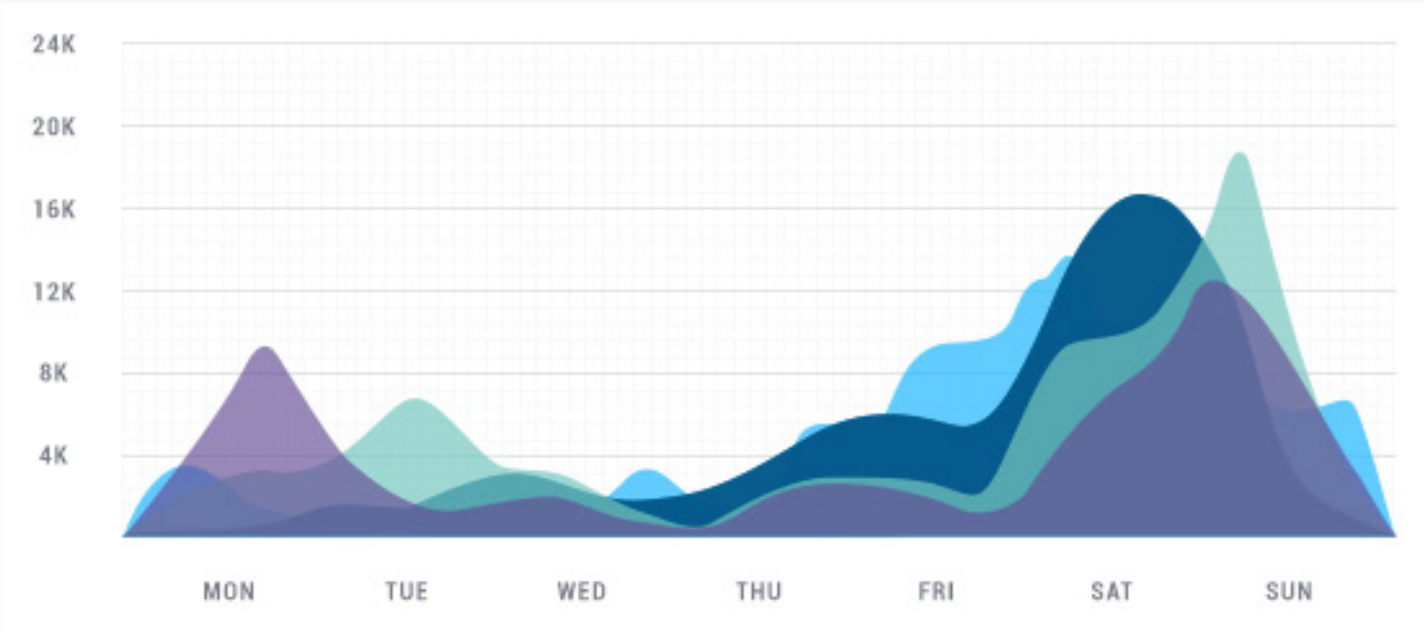

- There are many areas in BusinessView where graphs and charts are utilized. When generating new graphs or charts, all should retain this cohesive look and feel.
- **Sparkline Appearance:**
 - Green for positive, Orange for average, Red for Negative
- **Area Graph Color Order Appearance:**
 - GP blue, Teal, Purple, Light Blue
- **Bar Graph Color Order Appearance:**
 - GP blue, Teal, Purple, Light Blue
- **Donut Color Order Appearance:**
 - GP blue, Teal, Purple, Dark Blue (should sit between GP Blue and Teal to provide enough contrast)

MOTION

Motion is a highly useful tool when developing digital products. Although notes and helpful hints allow for further explanation of functionality, the use of motion leads and eases the user into using the interface. Throughout BusinessView, motion has been carefully applied to ease the user into various amounts of ample data as well as empowering them to leverage the useful functionality. It is highly recommended to apply motion to current and future Global Payment products.

MOTION RESOURCES

- Utilize the provided animations when developing the application.

RESPONSIVE GRID

BusinessView is designed as a responsive web application. It is based on a grid system with the use of columns and containers. The grid takes four different screen sizes into account. Each one takes the information displayed on the screen and adjusts layout based on the screen size/width and breakpoints. It is important to be cognizant of how much data and information can fit comfortably and legibly on each screen size and to make adjustments where necessary.

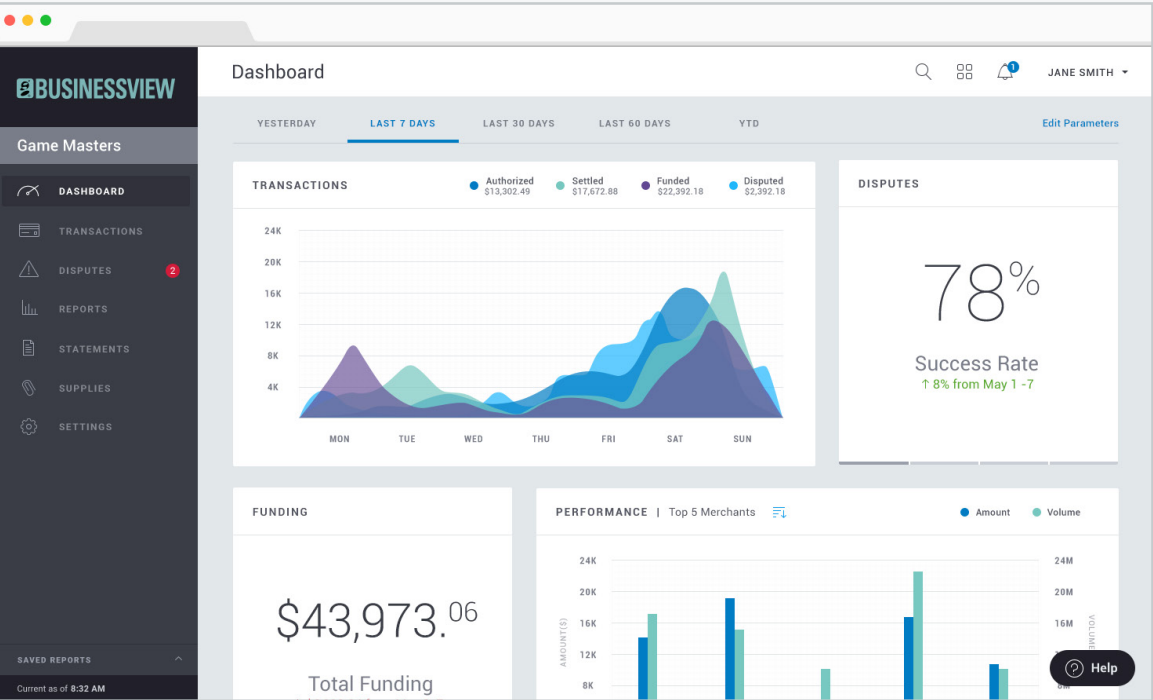

Screen Size	SMALL ≥640px	MEDIUM ≥768px	LARGE ≥1024px	X-LARGE ≥1480px
Container Width	576px	720px	940px	576px
Number of Columns	12 or reference 2 columns the width of 6 of the 12	12 or reference 2 columns the width of 6 of the 12	12	12
Gutter Width	30px 15px on each side of a column2	30px 15px on each side of a column2	30px 15px on each side of a column2	30px 15px on each side of a column2
Side Navigation Type	Drawer	Drawer	Icon Only with expandable drawer	Always Open

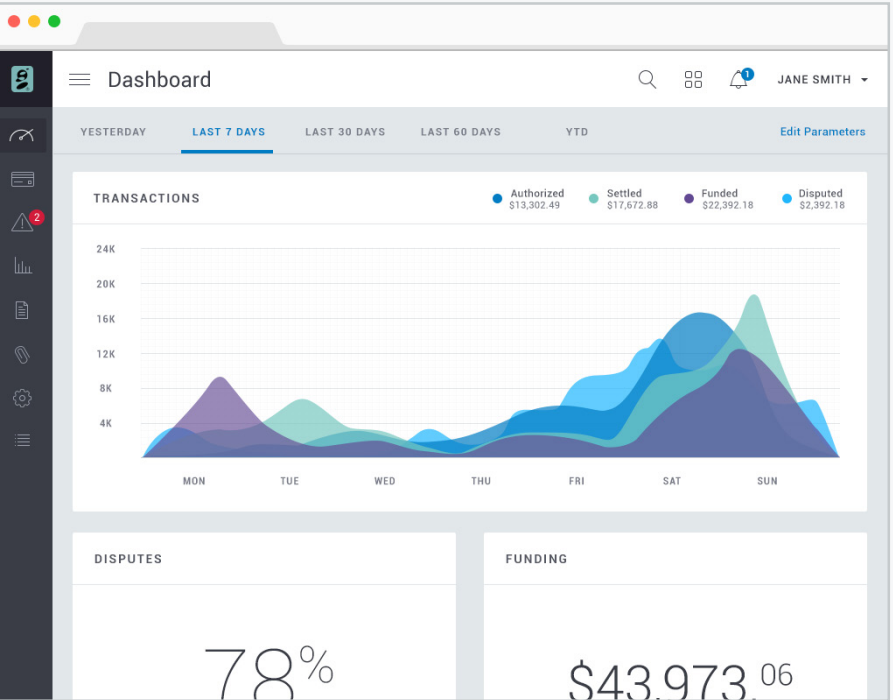

- ABOUT THE GRID SPECS
- Reference the grid specs for particulars about screen specs
 - These specs will help BusinessView retain a responsive cohesive layout no matter the screen size.

SCREEN SIZES AND BREAK POINTS

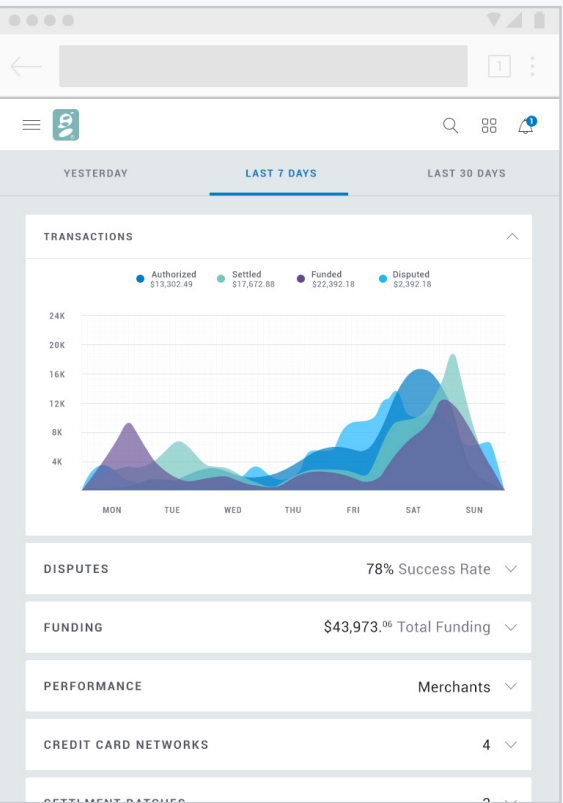

X-Large Screen

Large Screen

Medium Screen

Small Screen

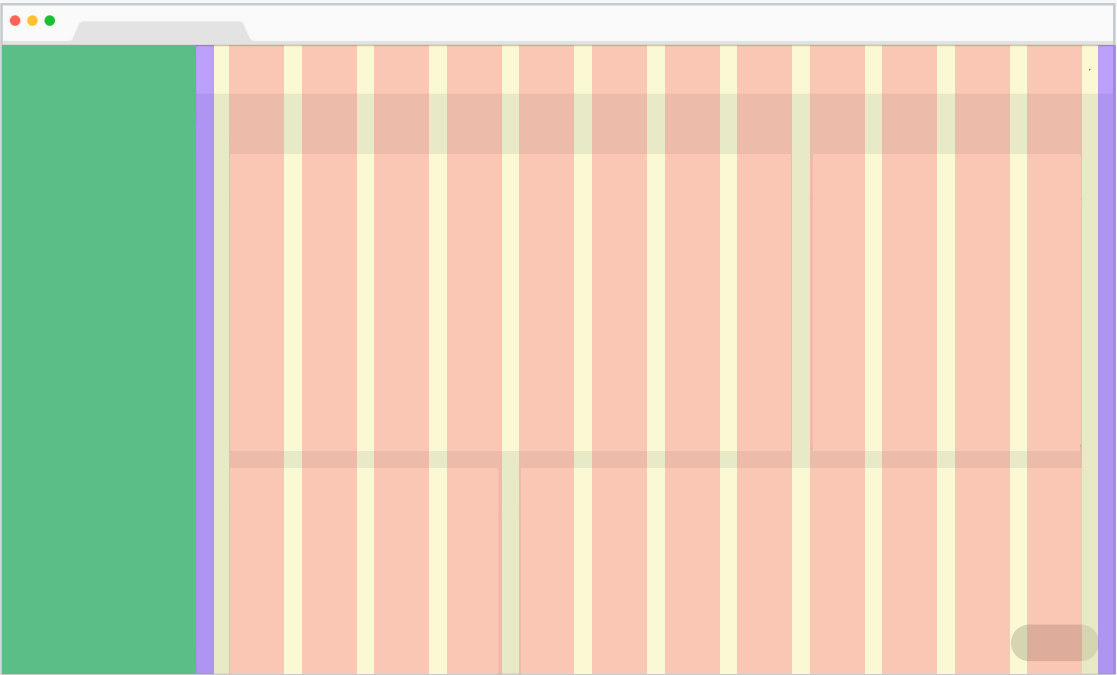

SCREEN SIZES

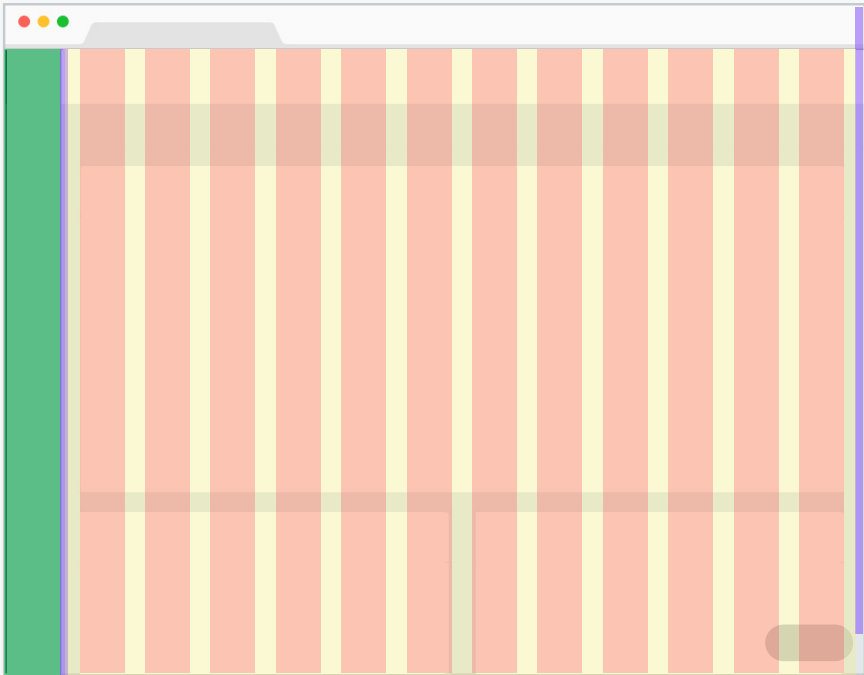

- Break points have been set based on each screen size:
 - **X-Large:** 1480px minimum screen size
 - **Large:** 1024px minimum screen size
 - **Medium:** 768px minimum screen size
 - **Small:** 640px minimum screen size

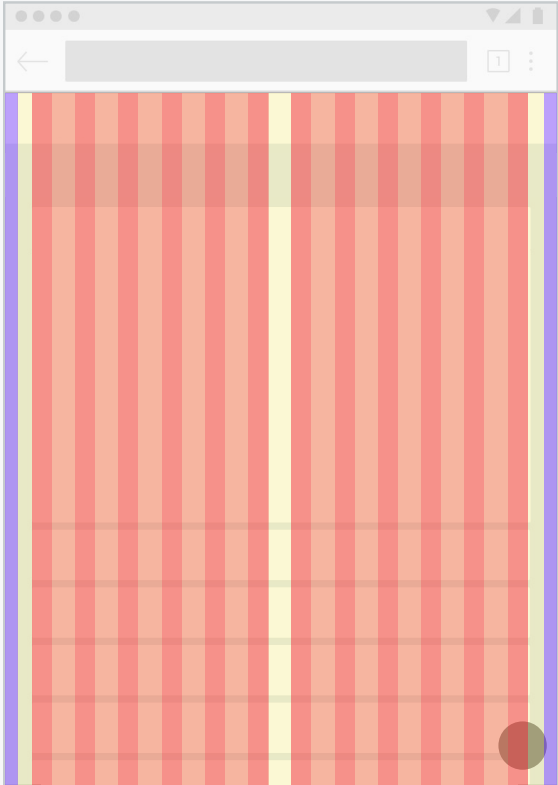

X-Large Screen

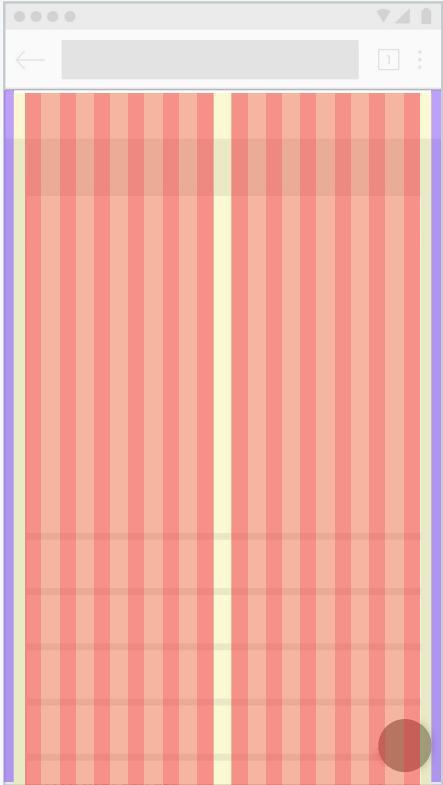

Large Screen

Medium Screen

Small Screen

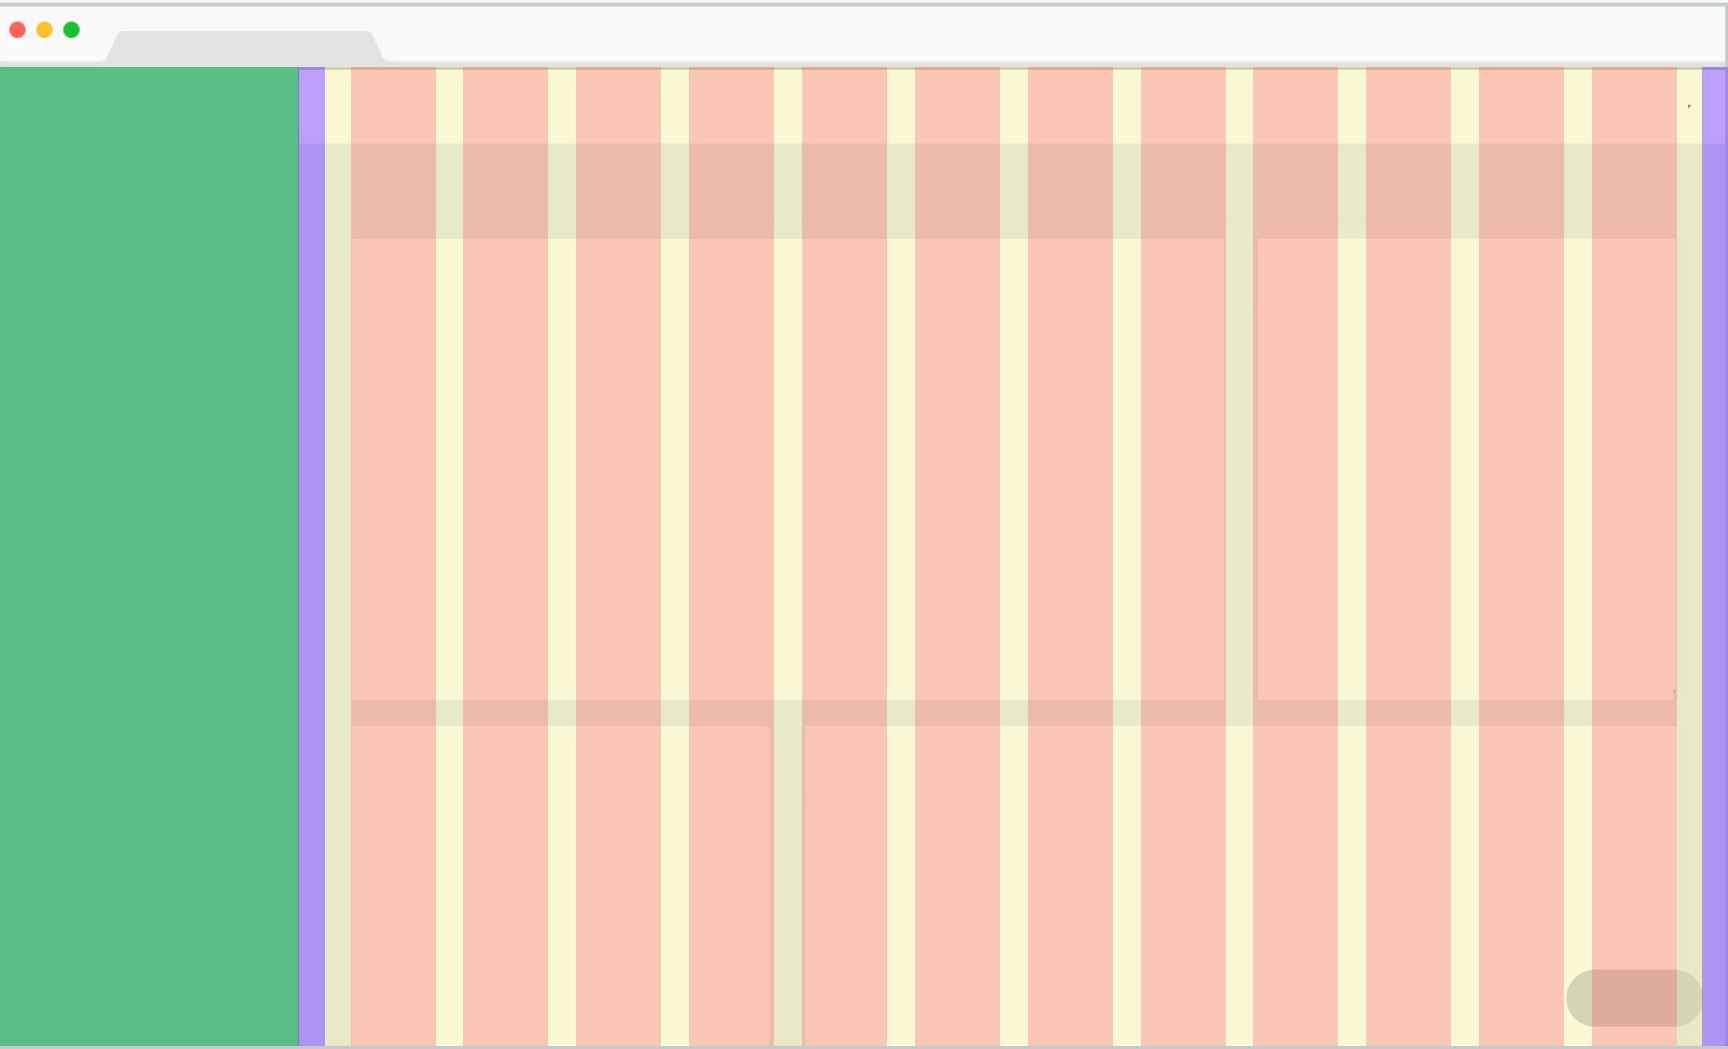

BREAK DOWN

- BusinessView is based on a 12 column grid system
- Each column grows and shrinks based on screen size while the gutters stay consistent. 30px (15px on each side of a cloumn).
- Illustrated is how the grid and naviation adjusts based on screen size. Use the color reference below.
 - Side Navigation Bar
 - Padding
 - Container
 - Columns

** The grid is laid out in the .psd deliverables that Chaotic Moon has provided to Global Payments

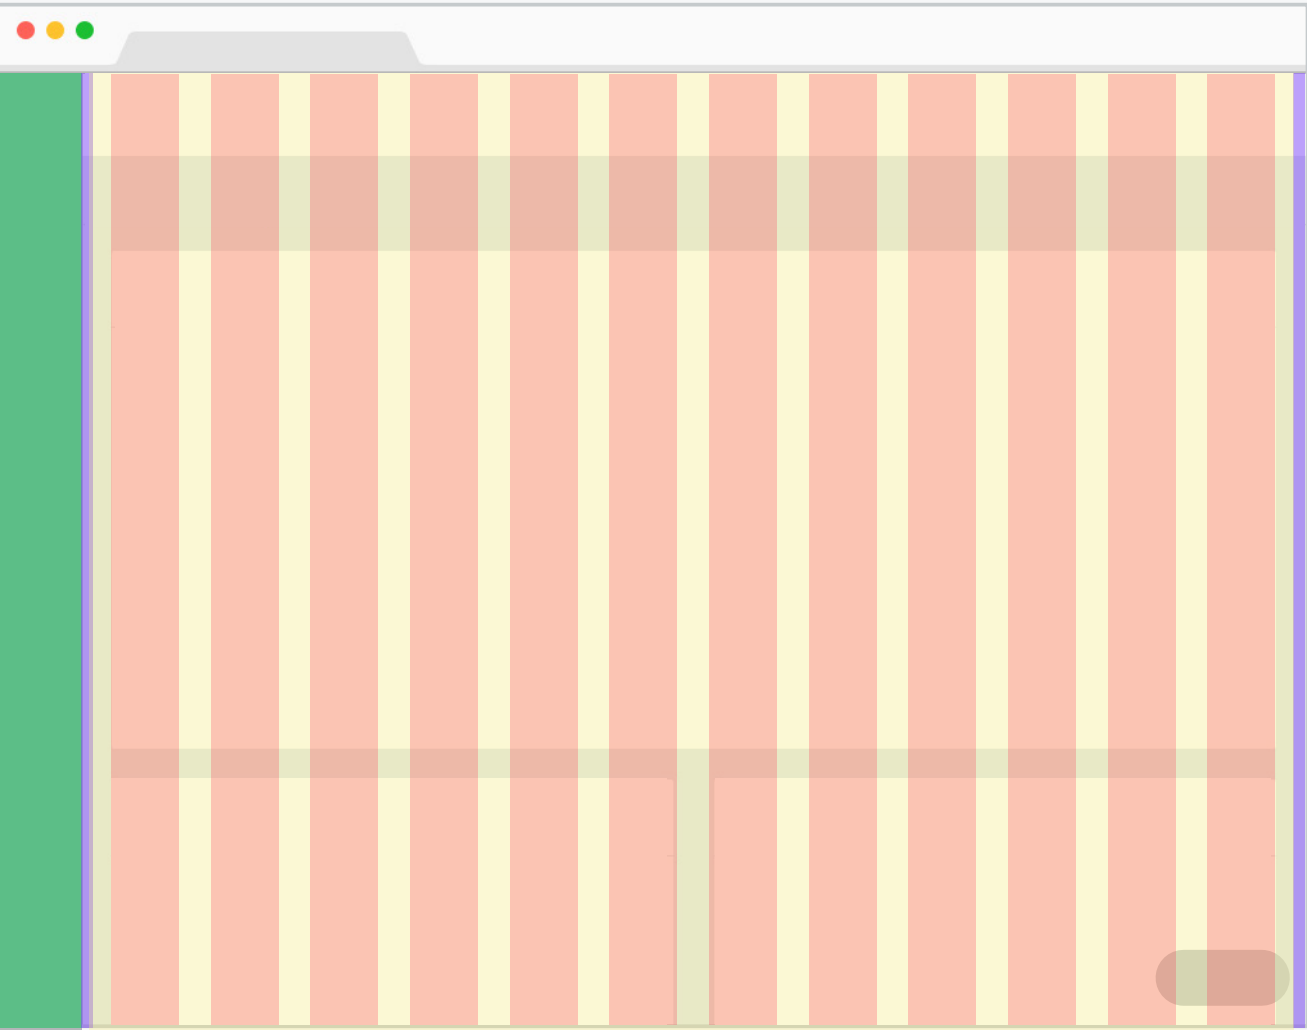

BREAK DOWN

- The container and grid act independetly from the navigation (side and top).
- For X-Large screens there will be a MAX WIDTH set on the container for the content to expand into.
 - **Container Max Width: 1260px**
- Content container will always stay centered
- The padding will extend on both sides when the user adjust the window to a larger size.

SPECS:

- Screen size: 1480px x 832px
- Container width: 1160px
- Column width: 66px
- Gutter width: 30px (15px on each side of a column)
- Side Nav width: 260px

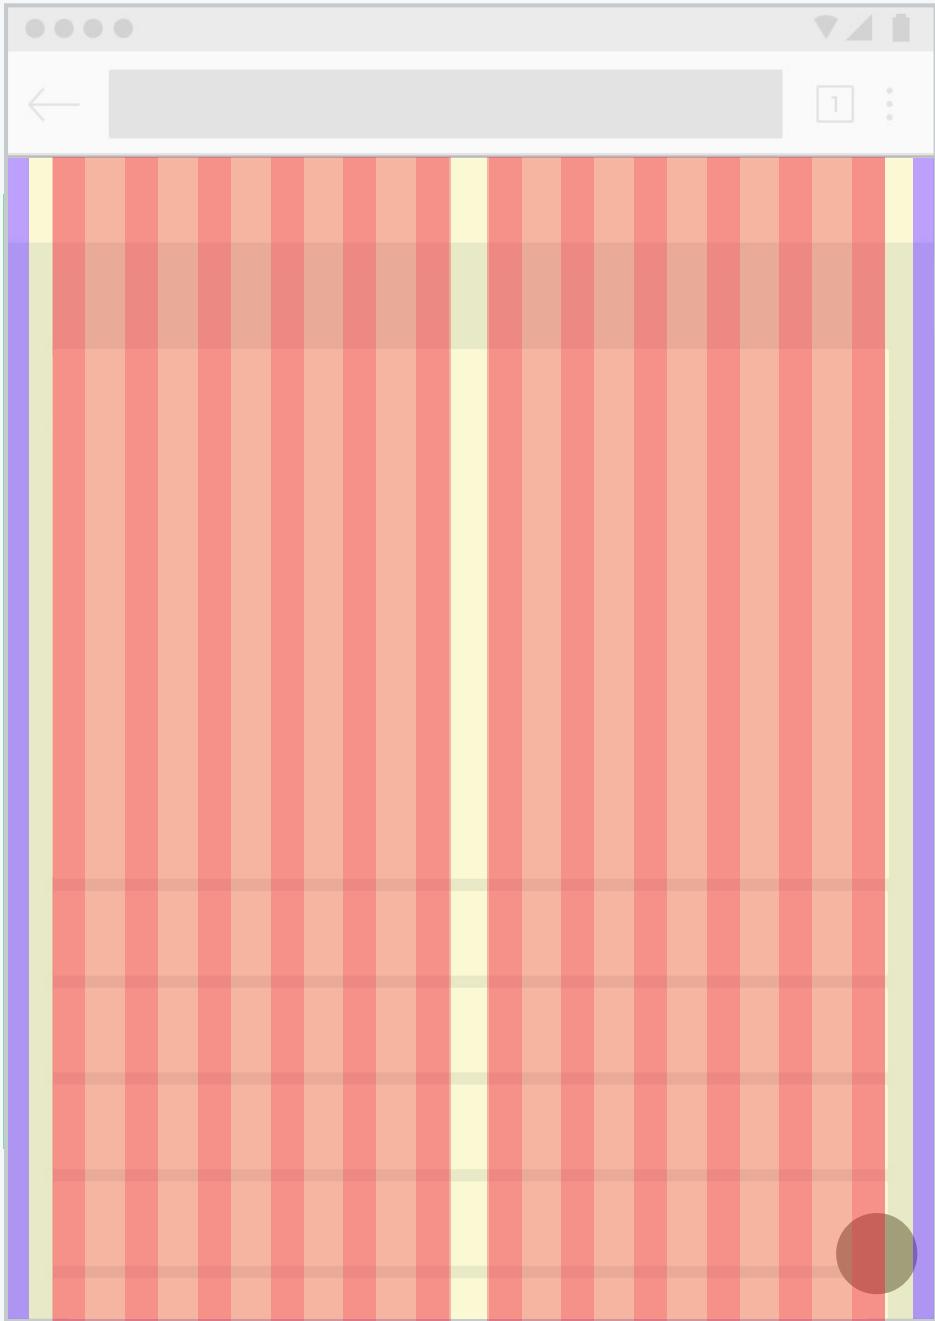

BREAK DOWN

- The container and grid act independetly from the navigation (side and top).
- Content container will always stay centered
- The padding will extend on both sides when the user adjust the window to a larger size.

SPECS:

- Screen size: 1024px x 768px
- Container width: 940px
- Column width: 48px / 49px
- Gutter width: 30px (15px on each side of a column)
- Side Nav Collapsed width: 68px

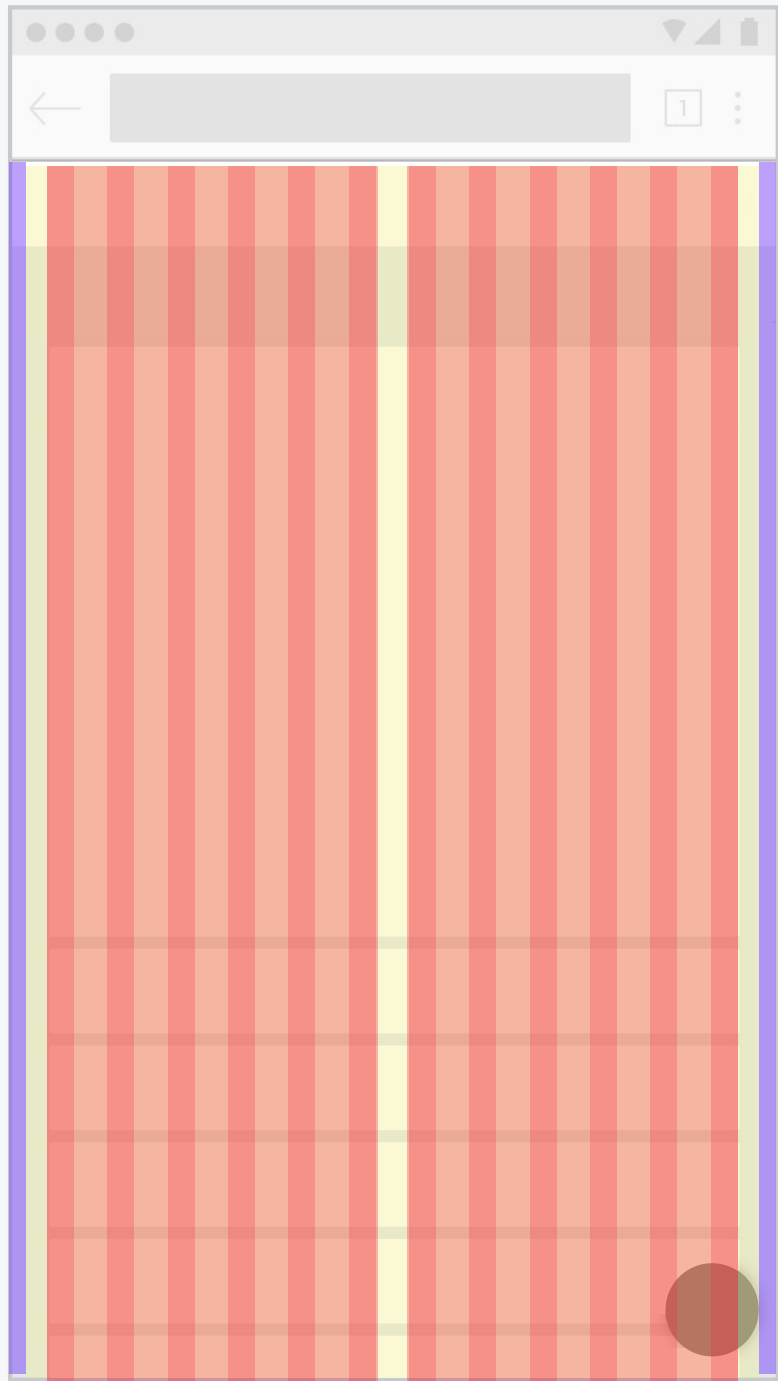

BREAK DOWN

- The naviagtion has transitioned to a drawer
- Content container will always stay centered
- The padding remain consistent

SPECS:

- Screen size: 768px x 1024px
- Container width: 720px
- Column width: 30px
- Column width: 30px = 12 columns 330px = 2 columns
- Gutter width: 30px (15px on each side of a column)

BREAK DOWN

- The naviagtion has transitioned to a drawer
- Content container will always stay centered
- The padding remain consistent

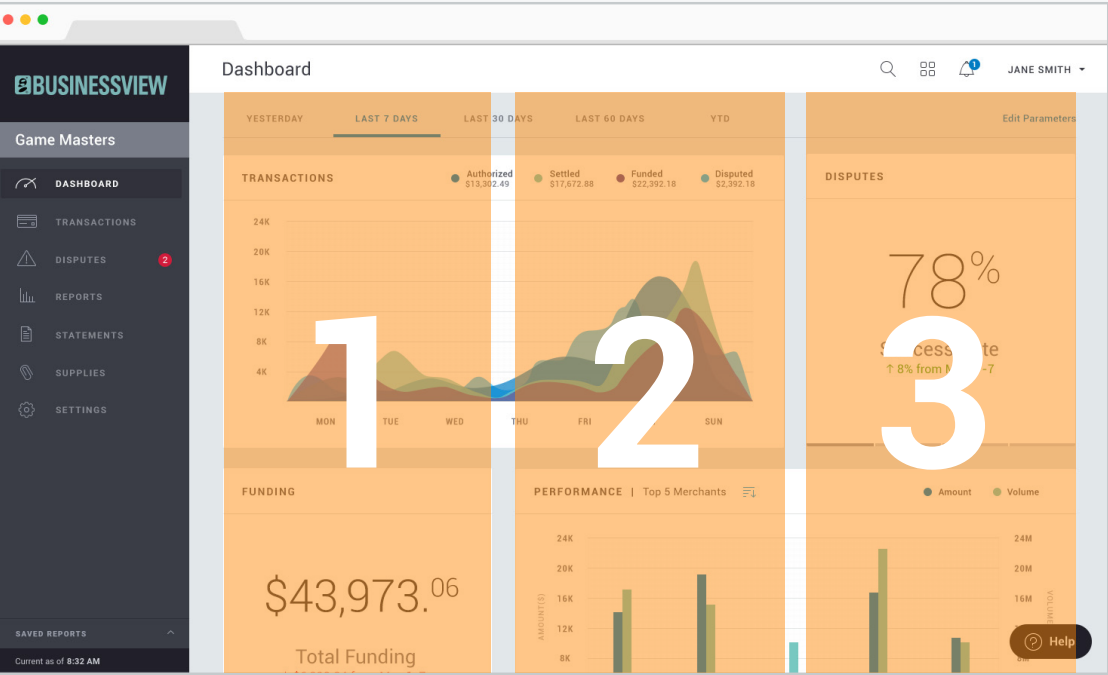

SPECS:

- Screen size: 640px x 1136px
- Container width: 576px
- Column width: 20px = 12 columns 270 = 2 columns
- Gutter width: 30px (15px on each side of a column)

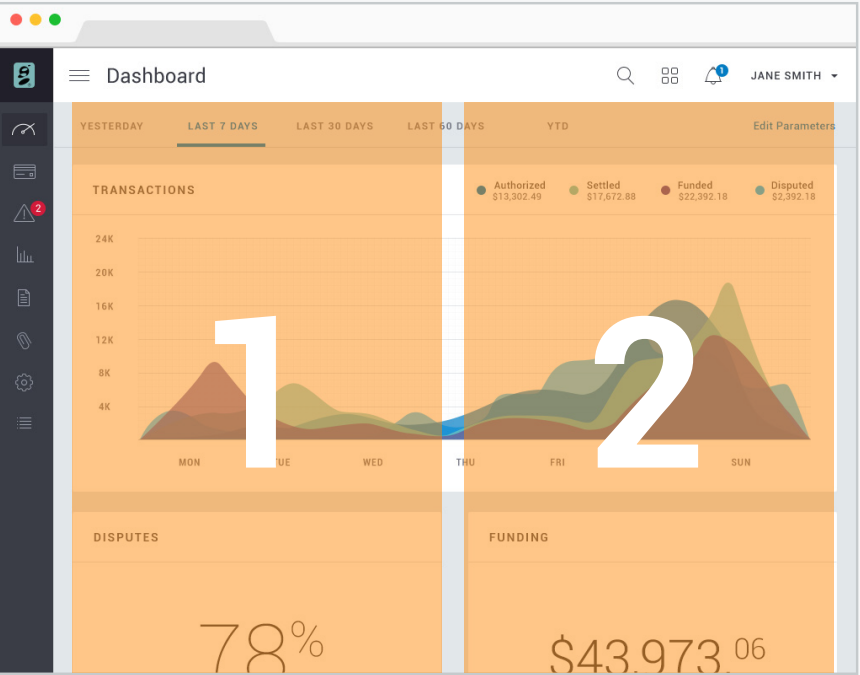

DASHBOARD DESIGN COLUMNS

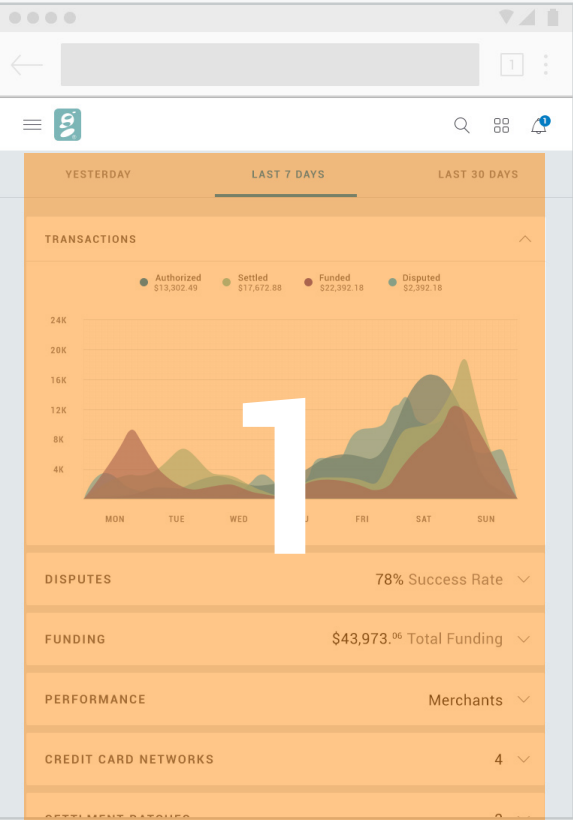

X-Large Screen

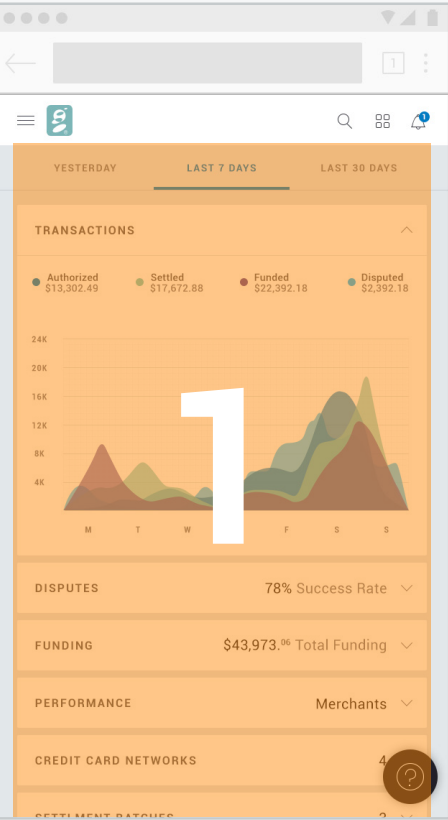

Large Screen

Medium Screen

Small Screen

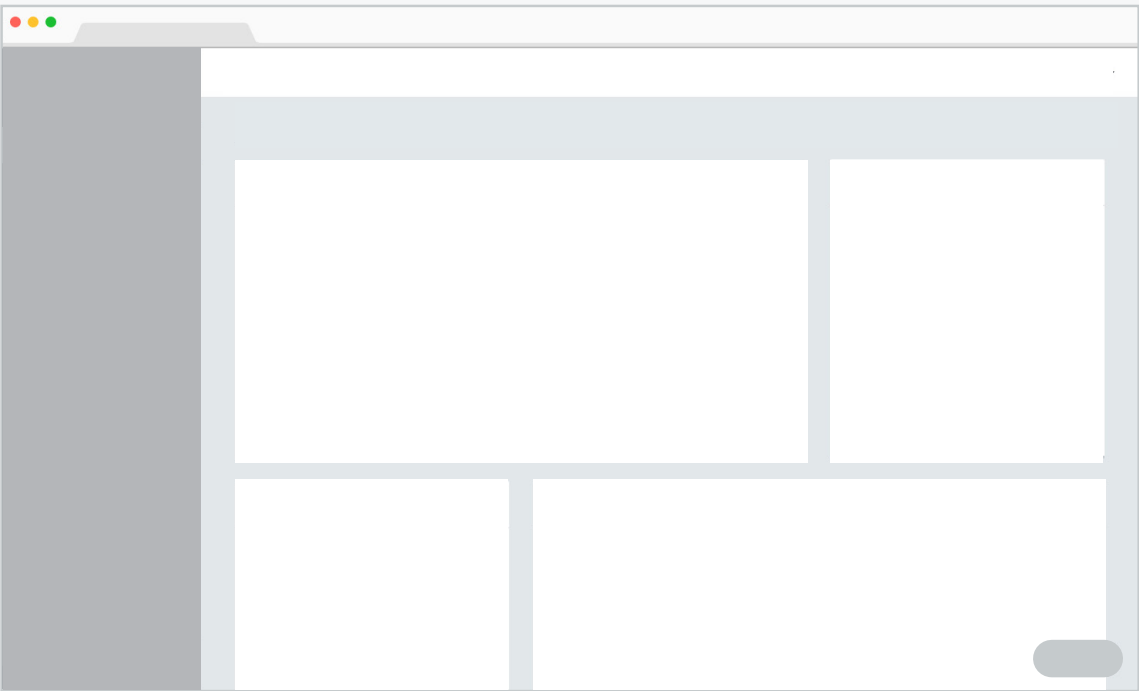

DESIGN COLUMNS FOR THE DASHBOARD

- In order to represent the informatino in on the dashboard in a legible manner, one must be aware the widgets and the “columns” they use. Note that these design columns being mentioned are not the same columns being referenced for developing break points.
- Each widget type takes up 1 or 2 columns. The max amount of columns will vary screen size to screen size.

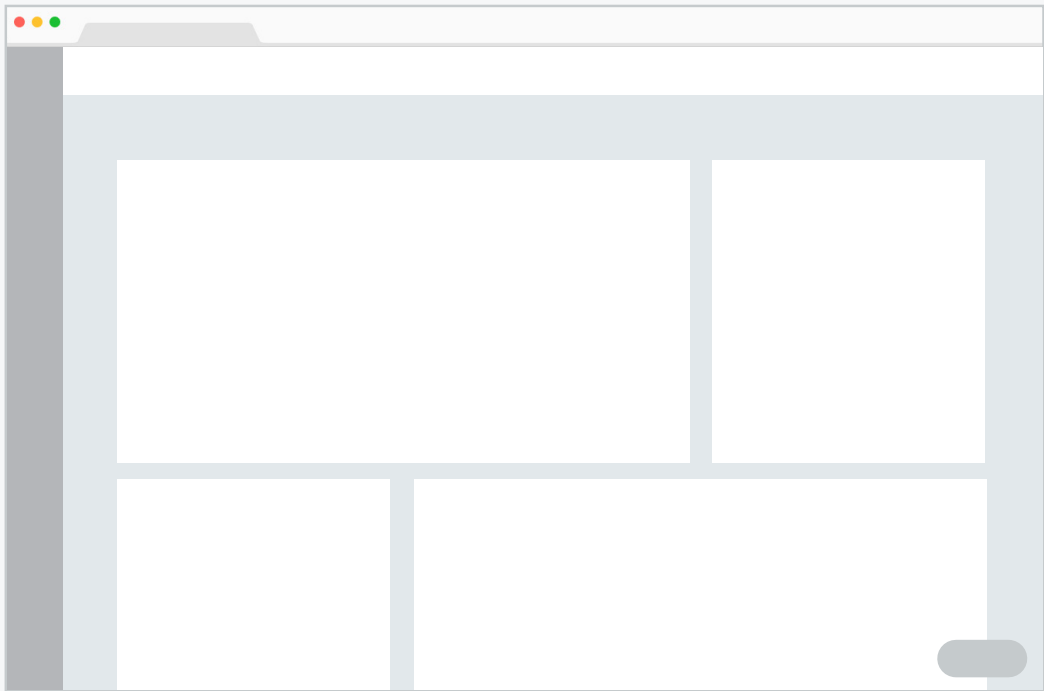

TRANSITIONING FROM X-LARGE TO LARGE SCREENS

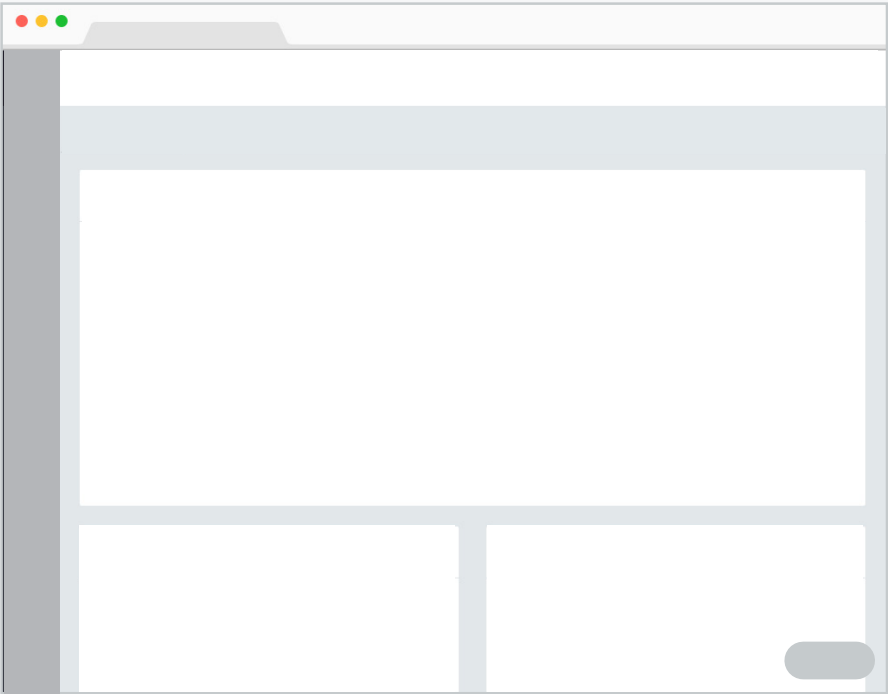

X-Large Screen

Transition

Large Screen

BREAK DOWN

- When the screen size is transitioning from X-Large to Large, the first UI element to change will be the side nav.
- The content will stay at in 3 columns until the screen size shrinks to about 1268px, then it will change to the Large screen layout.
